

NAME

curl_multi_remove_handle - remove an easy handle from a multi session

SYNOPSIS

```
#include <curl/curl.h>
```

```
CURLMcode curl_multi_remove_handle(CURLM *multi_handle, CURL *easy_handle);
```

DESCRIPTION

Removes a given `easy_handle` from the `multi_handle`. This will make the specified easy handle be removed from this multi handle's control.

When the easy handle has been removed from a multi stack, it is again perfectly legal to invoke `curl_easy_perform()` on this easy handle.

Removing a handle while being used, will effectively halt all transfers in progress.

RETURN VALUE

CURLMcode type, general libcurl multi interface error code.
